Introduction

Dozens of new ERC20 tokens are created and listed on Uniswap every day. How many of them were implemented due to fraudulent backgrounds is difficult to determine.

A good overview can be found here: <https://merv.tech/uniswap/new>

If these are legitimate projects, so-called “listing bots” are very often used. This triggers a purchase of tokens as soon as the liquidity of the trading pair is recognized on Uniswap. As a rule, the bots place an order faster than the normal user can trigger a purchase. Therefore the „common“ investor buys at a higher price.

In order to be able to offer investors this thrill without having to fear a rug or listing bots, two Uniburn game tokens have already been listed:

UBR: <https://www.dextools.io/app/uniswap/pair-explorer/0xf5b5d5ae9c4a89d76f150f359c335da184285ccd>

IUBR: <https://www.dextools.io/app/uniswap/pair-explorer/0x32fcce32a697cb93fe3a7caf8093d3f3e430762b>

As a test, the liquidity was only locked for a very short time frame in these two projects, whereupon investors saw no reason to hold the token. Both tokens had no sustainable use case.

To solve this problem we designed the UBN token.

UBN Features

The Uniburn network combines frictionless yield generation and the thrill of participating in the listing of new tokens. It consists of the UBN token and the Uniburn game tokens, hereinafter referred to as UBRG tokens. Every holder of UBN will enjoy benefits when participating in Uniburn games.

In order to ensure the sustainability of the token, 1.5% of the tax will be distributed to the holders of UBN and 1.5% will be burned to reduce the supply in **EVERY** transaction. This is done just by holding the tokens without paying high gas fees for stacking.

- 3% fee in total
- 1.5% is distributed immediately among all token holders
- 1.5% is immediately burned
- Owner of the contract is excluded. Therefore all rewards are distributed to the “real” holders.
- Ownership will be renounced after listing. Because of that, no more changes of the contract functions will be possible anymore
- As soon as the total supply is equal to 100,000, no tokens will be burned anymore. From then, 3% will be distributed among all UBN token holders

These features will already show up at presale. Early buyers will have a lot more UBN in their wallet at the end of the presale.

Example calculation

Simple example calculation in presale: If you are the first buyer and want to buy 10,000 UBN, you will get 9,700 UBN because of 3% total fee. 150 UBN are burned, 150 UBN are distributed to holders. “Holder” in that case is the presale contract, the owner is excluded of getting rewards. The second buyer buys 10,000 UBN and get 9,700 UBN. 150 UBN are burned, 150 UBN are distributed to your wallet and the presale contract in relation to the amount of UBN is held.

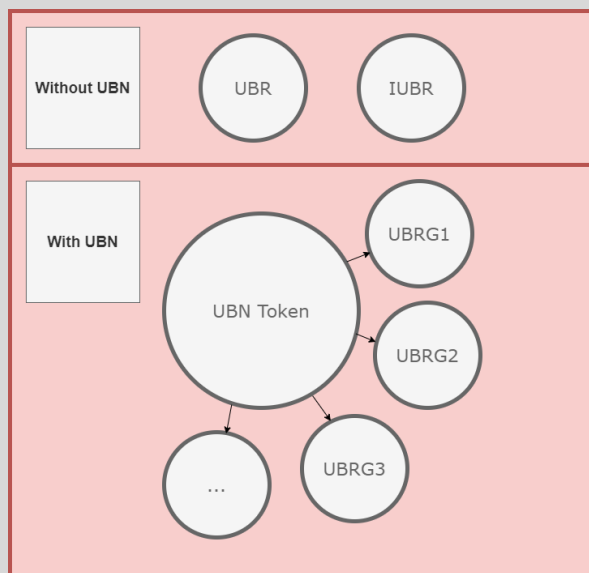

The number of UBN held by the presale contract gets less and less. In the end, all UBN from the tax (not the burn) are distributed to the holders.

Uniburn games

With UBR and IUBR we already implemented two trading tokens for the community. In addition to the fee structure of UBN itself, users also have the opportunity to receive further rewards or have advantages for participating in Uniburn games.

These can look like this:

- If the UBRG token has a burn rate of 4%, UBN holders only pay 2%
- If the UBRG token is realized with a presale option, slots will be reserved for UBN holders or they will get UBRG tokens at a better price
- If the UBRG token pays rewards to the participants, UBN holders are preferred

This are only examples and will be communicated and set before a Uniburn game starts. Uniburn games are planned every week. These games are also very useful for promoting UBN. Each game will be marketed independently. As a result, more and more users will know UBN and the benefits of the token.

Tokenomics

In terms of the Tokenomics of UBN, the total supply will be 1.000.000 tokens at the beginning of which:

- 600.000 will be assigned for the token sale (60%)
- 300.000 will be added to the liquidity pool in Uniswap (30%)
- 50.000 will be reserved for the team (5%)
- 50.000 will be reserved for marketing (5%)

- Liquidity will be locked for 12 months.
- Team tokens will be locked for 3 months.

100% of excess ETH from token sale are used for the creation and promotion of Uniburn games and the provision of liquidity for them. All unsold UBN tokens will be burned. Also those from marketing and team pool in proportion to unsold UBN in presale.

Conclusion

To sum it up, holders of **UBN** will be rewarded in the amount of 1.5% of **EVERY** transaction, for example:

- If UBN are transferred from one wallet to another
- If someone changes UBN to ETH
- If someone changes ETH to UBN
- If unsold UBN are transferred from presale contract to owner wallet
- If unsold UBN are burned
- If liquidity is provided at Uniswap

In case of participating in Uniburn games, which will take place every week, holders will have further advantages. Every time a game token is released, attention is directed not only to the game token itself, but also to UBN.

Once the total supply has been burned to 100,000, no more tokens will be burned. The last applicable 1.5% burn rate will be added to the share tax. From this point, 3% of each transaction will be distributed to token holders.
